

Using edging for Swisstrax tiles

- 1.) Edges can be used on all 4 sides of the tiles. Mounting clips are available when attaching the edges to a male peg side of a tile. Swisstrax corners are used when going around the tiles to join together the edges. The corners just snap into the underside of the edges.

- 2.) On the loop side of the tile simply snap in the edges. On a male peg to male peg application simply mount the clips on the ramps and then lift the tile and snap in the tile into the clips. (Refer to the file "clips" for further instructions"
